There are several common sleep disorders that people may experience when suffering from a medical condition, such as insomnia, sleep apnea, and excessive daytime sleepiness (EDS).

It may seem obvious, but these types of sleep disturbances can affect the brain's functioning, ability to concentrate, and cause anxiety and other changes in mood.

When a person becomes fatigued, they have trouble paying attention, have slower reaction time, make more errors, become forgetful, and may even fall asleep on the job. How is fatigue risk affecting your business?
